

Haines Phillips Architects now B.I.M. enabled

B.I.M. (Building Information Modelling) is a hot topic in the Construction Industry at present, representing a potential shift in working practices similar in scale to the original move from paper-based to 2D Computer Aided Design.

Haines Phillips have invested in updated software and training to enable us to take part in the B.I.M. Revolution – producing 3D Information-rich models from which all necessary fully coordinated 2D drawings and schedules can be extracted as required. We are already using this approach on selected projects for which it best suits the demands of a particular client or building type and we expect its use to expand in line with industry expectations.
